AC-2880-FR  
Bur in tungsten carbide  
with thin spiral cut  
for aluminum alloys working

The new implant impression tray is in aluminum, a material with rigidity and resistance suitable to impressions on implants.  
 The base of the implant impression tray is completely free from the handle, which is located in labial position, and from any anchor mechanism; this allows the operator to freely drill anywhere in the fall of the base support the implant.  
 The aluminum also allows to easily adjust the edges to the anatomy of the patient's mouth needs and avoids the annoying smell of burning plastic and helps to solve the problems of paste on the bur.

Easy to use and cost effective.  
 Rigid, but easily adjustable.  
 During drilling it doesn't produce unpleasant odors or smudge the bur like plastic materials.
